

Raspberry Pi, Arduino and Node MCU

↳ Raspberry Pi → is a mini-computer with more processing power and memory, acting as a general purpose computer. It is used for complex tasks.

→ It is a fully fledged computer and it is small as credit card and inexpensive.

→ It is a small single board computer (SBC)

→ It is developed by Raspberry Pi foundation in association with Broadcom company in UK during 2012.

→ \$35 computer board has changed the world.

→ Since its first release in 2012, company has sold more than 20 million units of Raspberry Pi boards.

→ ~~E~~ben Upton Founder, Raspberry Pi

→ Eben Upton, a British engineer who developed the board to address the concerns about the decline of computing skills in the UK and to make computer science more accessible.

→ The primary goal was to create a low-cost, small powerful computer which is used to teach and learning computer science.

NOTE:

Raspberry Pi = small, low cost general purpose computer

Arduino = small, low cost microcontroller board

NodeMCU = Wi-Fi enabled microcontroller board

* The ESP32 and NodeMCU, both commonly used in IoT projects. but they differ in their core components and capabilities.

↳ ESP32 → Microcontroller chip with built-in WiFi and Bluetooth. provides high processing power, memory and peripherals.

↳ NodeMCU → only WiFi feature and it is simpler and used for basic projects.

→ It is a small single board computer (SBC).

→ It is developed by Raspberry Pi Foundation in association with Broadcom company in UK during 2012.

→ \$35 computer board has changed the way.

→ Since its first release in 2012, computer has sold more than 20 million units of Raspberry Pi boards.

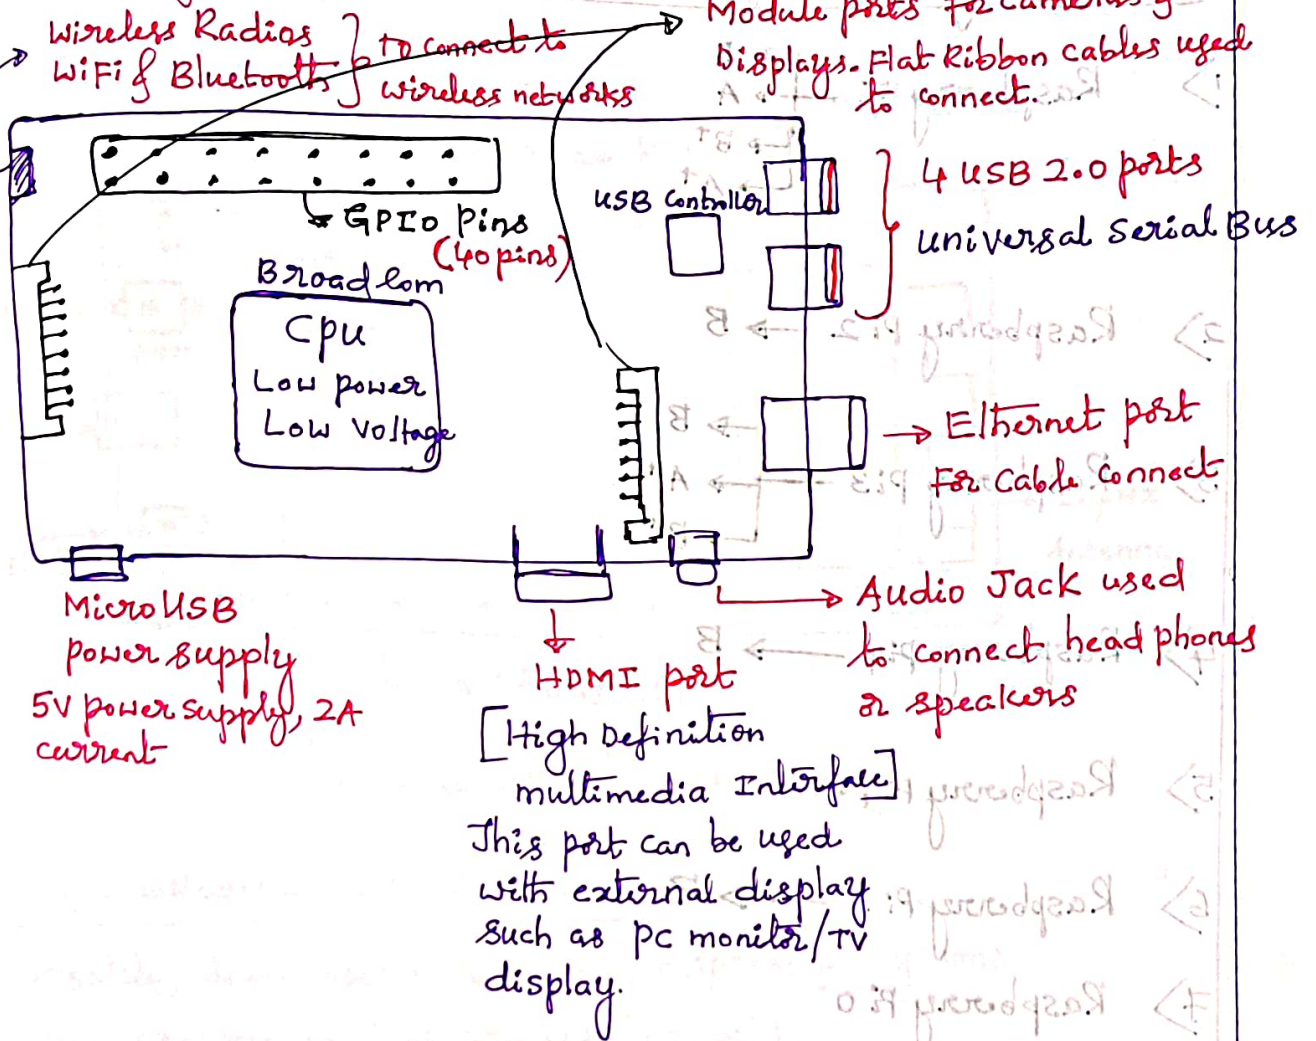

→ Raspberry Pi Foundation.

→ Raspberry Pi is British company who develops the board to address the issues about the decline of computing skills in the UK and to make computing more accessible.

→ The primary goal was to create a low-cost, small form factor computer which is used to teach and learning computer science.

Raspberry Pi = small, low cost, general purpose computer
 Arduino = small, low cost, single board microcontroller
 BeagleBone Black = small, low cost, single board computer

* Raspberry Pi

NOTE: MicroSD Slot: Raspberry Pi uses removable storage in the form of SD/MicroSD cards to run the operating systems.

SD → Secure digital card

↳ CPU = Low power low voltage CPU + GPU (Graphics processing unit)
+ Volatile RAM (1GB) [Few MB - Few GB]

↳ Memory unit = RAM + MicroSD card storage.

↳ MicroSD card ranges from 8GB to 32GB.

* Raspberry pi family and Model

- 1) Raspberry Pi

- 2) Raspberry pi 2 \rightarrow B

- 3) Raspberry pi3

- 4) Raspberry pi4 \rightarrow B

- 5) Raspberry Pi pico

- 6) Raspberry Pi 5 \rightarrow 13

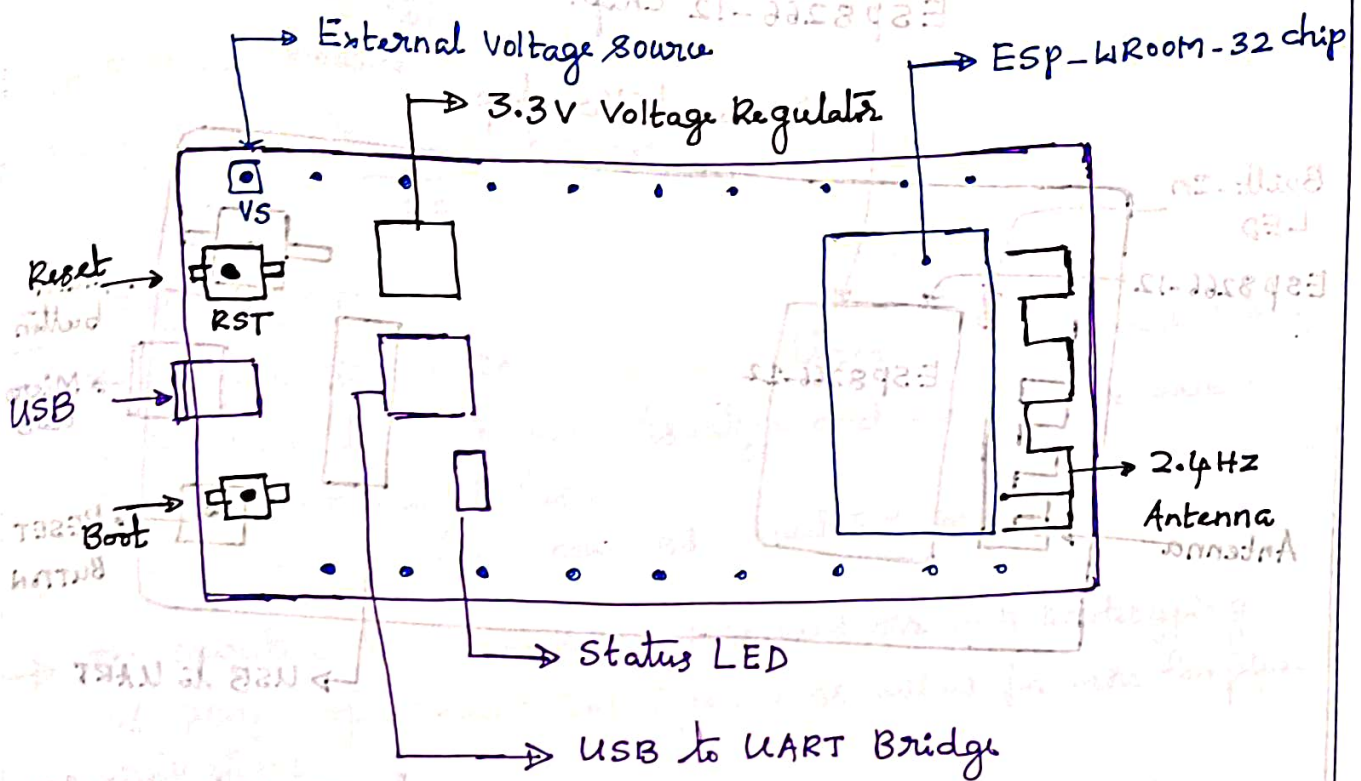

- ## 7) Raspberry Pi 0

NOTE: Microsed slat; Raspberry 1st was removed 2/25/12
in the form of 20/microsed count
to run the operating system
20 - 2000 digital count

$\left[\frac{d}{dt} \right]_{\text{total}} = \left(\frac{d}{dt} \right)_{\text{MAS}}$

* ESP32 Board :

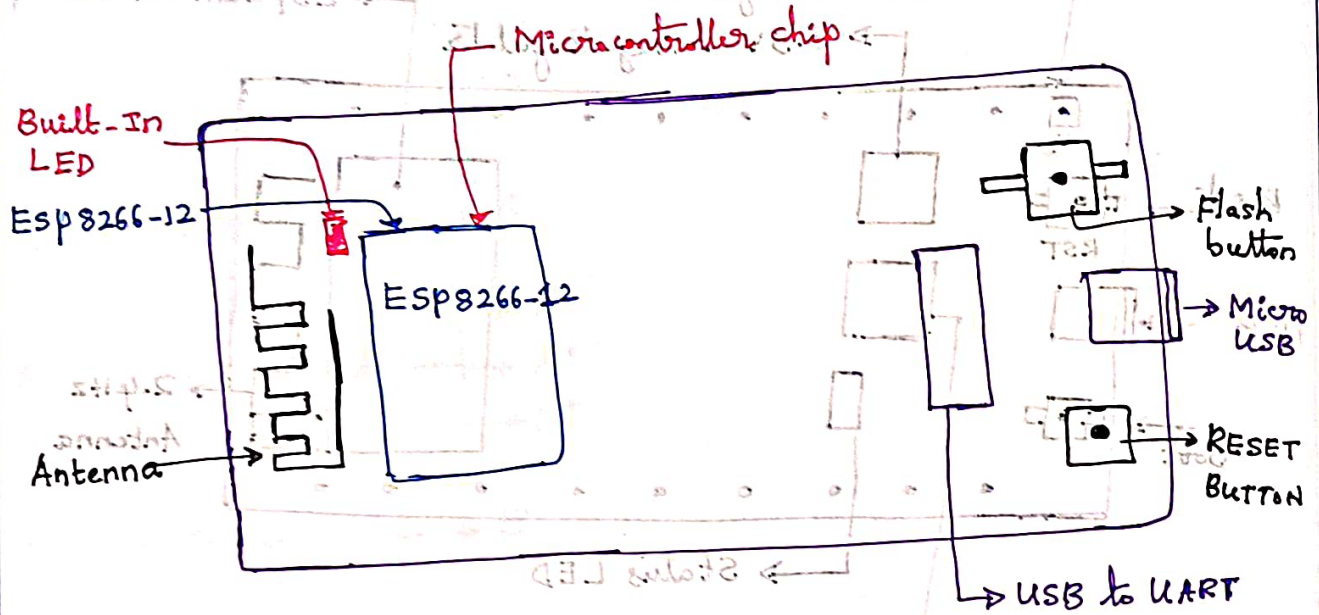

↳ ESP-WROOM-32 chip contains the following :

- Versatile, low-cost module from Espressif systems
- Dual-core Xtensa LX6 processor (32-bit)
- provides built-in WiFi and Bluetooth.
- Low power consumption feature.
- Includes variety of peripherals like GPIOs, UART, SPI, I2C etc.
- Widely used in IoT due to its affordability, ease of use and Versatility.

ESP-WROOM-32 MC chip contains the Tensilica Xtensa Dual-core 32-bit LX6 processor.

* NodeMcu : Is a development board built around the Esp8266-12 chip.

↳ Esp8266-12 : This chip consists of processor, memory, WI-FI and other peripherals.

↳ processor : is Tensilica Xtensa 32-bit LX106 RISC processor.

↳ Esp8266 uc chip contains the Tensilica LX106 32-bit processor

* Conclusion :

↳ Esp-WROOM-32 uc chip (Esp32 uc) is advanced microcontroller board chip with built-in WiFi and Bluetooth.

↳ NodeMcu board is often associated with Esp8266 uc

* NOTE

1) NodeMCU (ESP8266) board

2) ESP32 board

3) NodeMCU (ESP32) board

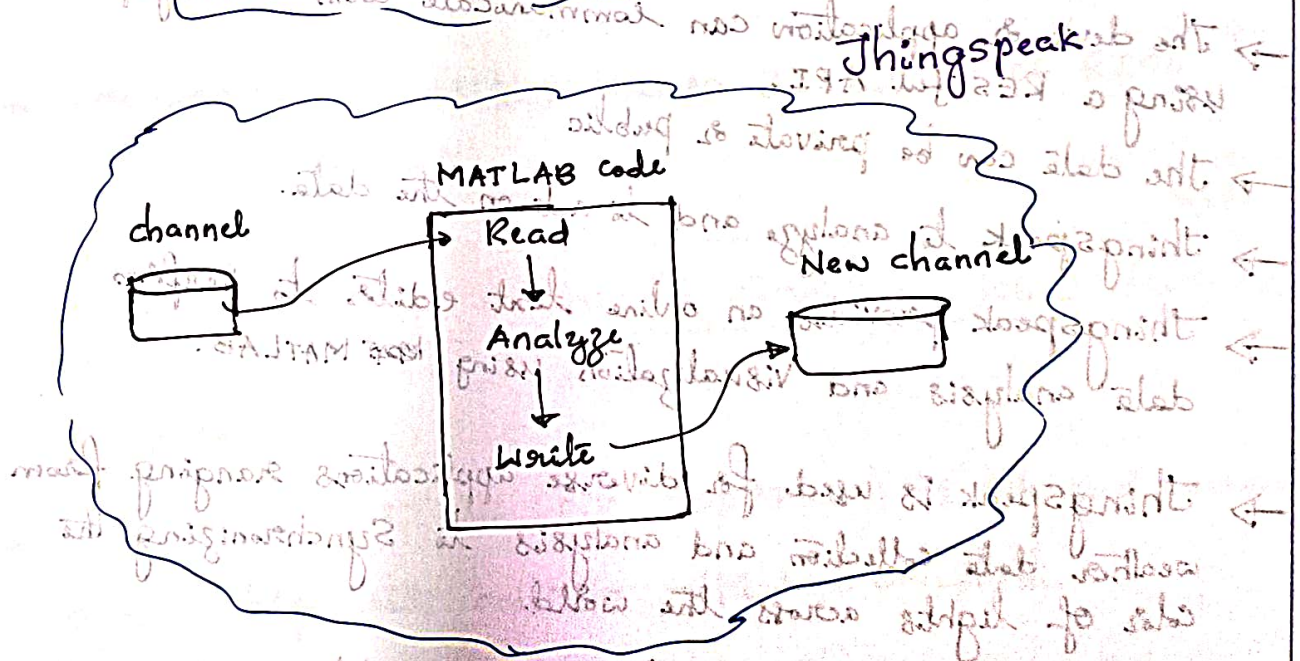

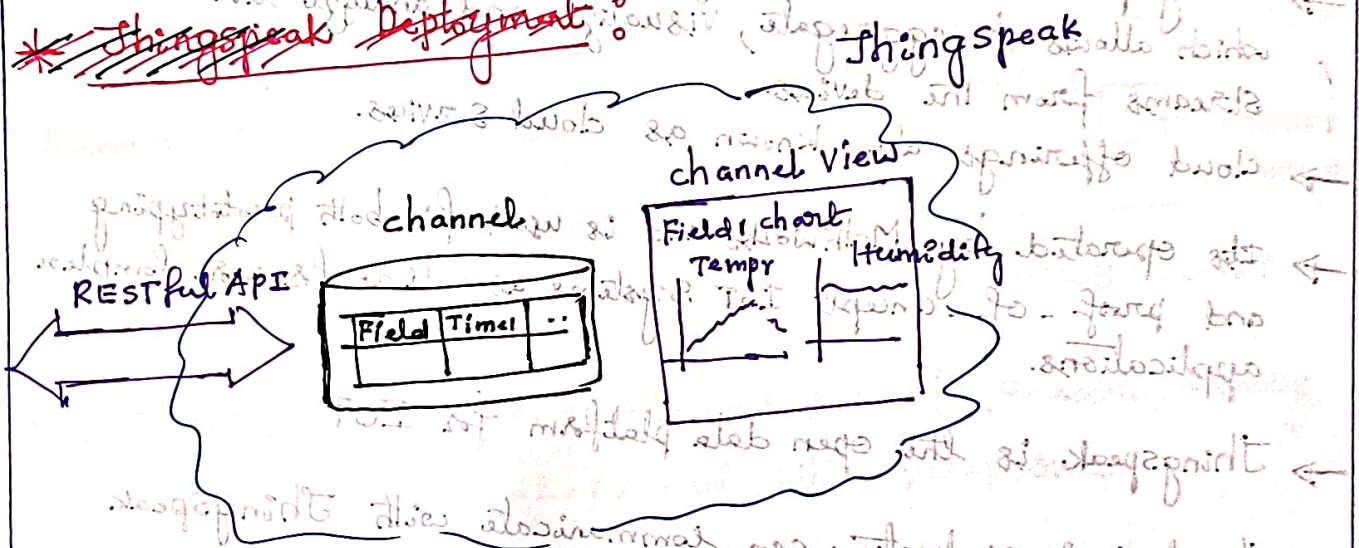

* cloud offerings:

- ThingSpeak is an IoT analytics platform, a cloud based service, which allows to aggregate, visualize and analyze live data streams from the devices.
- cloud offerings also known as cloud services.
- Its operated by Mathworks and is used for both prototyping and proof-of-concept IoT Systems as well as for more complex applications.
- ThingSpeak is the open data platform for IoT
- The device or application can communicate with ThingSpeak using a RESTful API.
- The data can be private or public
- ThingSpeak to analyze and to act on the data.
- ThingSpeak provides an online text editor to perform data analysis and visualization using MATLAB.
- ThingSpeak is used for diverse applications ranging from weather data collection and analysis to synchronizing the color of lights across the world.
- ThingSpeak provides the time series database. It provides the users with free time-series data storage in channels. Each channel includes data fields.

NOTE: Thingspeak and xively are distinct IoT platforms, though they share some similarities.

- Thingspeak is an open-source platform from Mathworks primarily used for DIY projects.
- Xively is a commercial PaaS (platform as a service) for IoT applications.

* Thingspeak Deployment:

Thingspeak provides the time series database it provides the users with four time series data storage in channels. Each channel includes data fields.

* Thingspeak Deployment :

- Deployment involves connecting devices to Thingspeak to send and receive data, visualize it, analyze it.
- The process starts with by configuring the devices (like Raspberry Pi, Esp32, NodeMCU) to communicate with Thingspeak using HTTP or MQTT protocols.
- Setting up a channel
- obtain the API keys (Write API key & Read API key)
- configure the device to send data to the channel.

↳ Detailed Steps :

1. To setup a Thingspeak channel.
 - Login to user Thingspeak account and create a new channel.
 - Need to provide a channel name and description
 - Need to configure the channel as private or public
2. Device configuration:
 - API keys: obtaining the ^{user} "Write API key and Read API key" from the Thingspeak Account.
 - configure the device (Ex: Esp32, Raspberry Pi) to:
 - Access the Internet
 - using suitable protocol (HTTP/MQTT) for sending data.
 - Specify the Thingspeak channel ID and write API key in the configuration.

NOTE : MQTT → "Message Queuing Telemetry Transport"

3. send data to Thingspeak

— Data format

— HTTP/MQTT: use the configured API key and channel ID to send data to Thingspeak by using HTTP & MQTT.

4. Visualize and Analyze data:

→ Thingspeak Interface: Thingspeak provides a web interface to visualize the data in real-time

→ Data import/Export: We can import & export the data from the channel.

→ Integration with MATLAB: Thingspeak is integrated with MATLAB for advanced data analysis and visualization

* Features of AWS (Amazon Web Services) IoT :

- AWS IoT which connects the IoT devices to AWS services which provides the solutions.
- Key Features: Secure device management, Analytics and visualization of device data.

Thingspeak Vs AWS IoT

Thingspeak

- cloud-based platform for data logging, visualization and basic data analysis.
- user friendly, simplicity and ease of use for projects involving Arduino or Raspberry pi

AWS IoT

- For Video analytics, device management, high sophisticated data processing and high level data analytics capabilities.
- It's designed for large scale enterprises.
